

Network Microsimulation Extension to Activity-Based Travel Model

Craig Heither, CMAP

Presented to CATMUG, April 3, 2013

CMAP's Need

2

GO TO 2040 recommends several approaches to strategic investment in future transportation improvements.

- Transportation management
- Operational
- Major capital projects

Evaluation relies on quality projections of future travel and transportation system performance.

CMAP's ABM

Key Shortcoming

3

ABMs rely on skims from static assignments.

- Can't provide information on real-time conditions
- Thus limits model's predictive powers

CMAP's Goal

4

Extend ABM capabilities to include dynamic sensitivity to multi-modal network conditions.

To get there:

- Regional multi-modal network simulation
- Integrate microsimulation with ABM

Regional Network Microsimulation

5

- Travelers using auto/bus/bicycle modes
- Interface with rail passenger and walk modes

Integrate Microsimulation with ABM

6

- *En route* knowledge from microsimulation used by ABM

Consultant Team

7

Parsons Brinckerhoff
with
Northwestern University Transportation Center

Multi-Modal Network Microsimulation

8

DYNASmart-P platform

- Individual agents as decision-makers
- Different information availability states for agents
- Flexibility in loading network
- Heterogeneous user preferences in path-finding
- Algorithms for equilibration of large-scale networks

Microsimulating Alternative Modes

9

- Bus transit/intermodal transit

Vehicular movements simulated along with auto

- Rail Transit

Modeled as scheduled mode

- Bicycle

Average roadway speed or sidewalk-riding conditions

- Pedestrian

Average speed for walk links

Enhanced Spatial Resolution

10

Implement microsimulation as MAZ-to-MAZ trips

DTA-ABM Integration LOS Issue

11

DTA feedback doesn't meet LOS needs of ABM.

Pre-Sample trip destinations

- Primary tour destinations

- ▣ 400 for each origin & travel segment
- ▣ 40 of 400 for each individual & travel segment

- Secondary stop locations

- ▣ 400 for each OD pair & travel segment
- ▣ 40 of 400 for each individual, primary destination & travel segment

Daily Level Integration

12

- Entire day ABM run
- Entire day microsimulation
- No substantial change to ABM or DTA

Trip/Activity Level Integration

13

Real-Time Level Integration

14

- Feedback to ABM before end of trip
- Flexible re-routing in DYNASMART
- Extend feature to re-plan remaining trips

ABM Modifications

15

- Finer temporal resolution for trip departure
5 minutes
- Auto occupancy and explicit driver-passenger roles

Project Timeframe

16

- Task 1. Design Analysis Framework
(Mar. – Jun. 2013)
- Task 2. Produce a Multi-Modal Network Microsimulation
(Jul. 2013 – Jun. 2014)
- Task 3. Integrate Network Microsimulation with ABM
(Jul. 2014 – Mar. 2015)
- Task 4. Final Documentation and Wrap-Up
(Apr. 2015 – Jun. 2015)

Thank You!
